PRODUCT CODE: VQ-SBNK057-LACR-US

Stove Top Kettle

The VQ Stove Top Kettle is an investment that will prove its worth every time you use it. When properly cared for, your VQ Stove Top Kettle will give you countless years of service and pleasure. Follow the use and care suggestions in this leaflet to preserve and maintain the Kettle's original beauty.

Important Safety Precautions

Always place your stove top kettle on a stable, flat and heat resistant surface.

Never leave the kettle unattended when in use.

Maximum capacity is 3.0L; however, the practical capacity is 2.5L to avoid water ejecting out the spout during boiling.

Do not fill with water above the bottom of the spout.

Ensure that the lid is securely in place before heating.

Never heat the kettle when empty. This can cause serious damage to both the kettle and the stovetop. Add a minimum 2 cups of water.

Avoid exposing the handle and spout to direct flame or excessive heat.

Only use the kettle for boiling water.

Never wash your kettle in a dishwasher

Using the Kettle

1. Filling the Kettle:

Fill the kettle with cold water.

Do not fill over the bottom of the spout to prevent boiling water ejecting from the kettle.

Fill with a minimum 2 cups of water to prevent the kettle overheating or boiling dry.

2. Heating the Kettle:

Use medium heat to boil the water. Avoid using high heat as it may damage the kettle or discolour its surface.

When using a gas burner, ensure the flame touches only the bottom of the kettle, and not the sides. This helps avoid discolouration and wasted energy.

The kettle will whistle when the water boils. Turn off the heat immediately after the whistle to prevent overheating or boiling over.

3. Using Over Gas Burners:

Use a small to medium-sized burner. Make sure the flame is concentrated on the base of the kettle and not up the sides to prevent energy waste and permanent discolouration.

Your kettle has exceptionally high thermos-conductivity, and even a lower setting on some gas burners may overheat. An inexpensive gas “flame tamer” placed between the burner and bottom of the kettle solves this problem. Flame tamers are readily available at most hardware stores.

4. Using Over Electric Stove Tops:

Ensure that the heating element is smaller or equal to the base of the kettle to ensure even heat distribution and efficient boiling.

5. Pouring:

Do not pour your kettle while the water is rapidly boiling.

We recommend using a pot holder or mitt when pouring as the handle may be hot.

Do not pour the kettle without the lid being securely attached.

After pouring do not place the kettle back on the hot stove plate.

🔍 Care and Maintenance

1. Cleaning:

Allow the kettle to cool before cleaning.

Wash the inside of the kettle with warm soapy water, rinse with clean water, and dry it thoroughly.

Wipe the outside of your kettle with a clean, soft and damp cloth.

Avoid using abrasive cleaners and detergents that could scratch or damage the surface.

Do not immerse the kettle completely in water, especially if it has wooden or heat-resistant handles.

Depending where you live, some water may have excessive minerals, calcium or lime scale. Periodically remove mineral deposits to keep your kettle clean and operating efficiently.

Use a commercial lime scale product to remove deposits. Follow the directions on the packaging carefully to avoid damage to your kettle.

Alternatively use a home remedy by boiling water with 2 tablespoons of baking soda and the juice of half a lemon, or mix a solution of vinegar or lemon juice. Repeatedly rinse with clean water to remove any after taste.

2. Storing the Kettle:

Store the kettle in a cool, dry place when not in use.

Avoid stacking heavy objects on top of the kettle, as this may distort its shape.

🔒 Preventing Discolouration and Overheating

Always use medium heat to boil water and avoid prolonged exposure to heat after boiling.

Discolouration can occur if the kettle is heated without water, overheated, or if the heat from the flame spreads up the sides.

Avoid overheating the kettle by turning off the burner as soon as the water has boiled.

🔒 Troubleshooting

1. The kettle does not whistle:

Ensure that the lid is fitted securely and the spout is free of any blockages.

Ensure the Whistle is correctly seated on the end of the spout.

Ensure there is sufficient water in the kettle and it is boiling.

2. Water is spilling from the spout:

Ensure that the water level is below the bottom of the spout.
